Executive findings

• P0: SCIM handler control-flow is malformed (user GET block has a dangling conditional and merges unrelated blocks). This breaks SCIM conformance and makes parts of SCIM unreachable.
• Strong delivery posture: CI workflows, CodeQL, secret scanning, lockfile, and SBOM tooling are present in-repo.
• SSO capability exists (OIDC start/callback + JWKS caching tables).
• ETag + If-Match preconditions are implemented broadly (good for concurrency + tamper resistance).

Readiness scorecard

Category	Score	Notes
Security	82	OIDC + SCIM scaffolding + ETags/preconditions + CI scanning + secrets scanning; degraded by SCIM routing bug.
Tenant Isolation	84	Org-scoped queries + tenant-safe project sync patterns.
Compliance & Audit	74	Audit logs + security policy + SBOM artifacts; SCIM behavior needs fix to claim conformance.
Reliability	58	P0 SCIM handler control-flow issue reduces correctness; otherwise solid serverless patterns.
Observability	52	Request IDs present; missing real metrics/traces/alerts.
DevEx & Delivery	82	CI workflows + CodeQL + secret scan + lockfile + tests + SBOM tooling included.
Performance	68	Pagination + ETags; still no diff-sync/compression at scale.
Maintainability	60	Single-file FE/API is dense; good guardrails but needs modularization over time.

Control verification (present/absent)

Control	Status
CI workflows (.github/workflows)	YES
CodeQL	YES
Secret scanning (gitleaks)	YES
Lockfile (package-lock.json)	YES
SBOM (CycloneDX)	YES
Security policy (SECURITY.md)	YES
OIDC SSO endpoints	YES
SCIM endpoints	YES
ETags + preconditions	YES
Distributed rate limiting	YES
Audit logs	YES
P0 SCIM routing bug detected	YES

Critical issue evidence (P0)

SCIM User GET block has a dangling conditional, and subsequent SCIM blocks are merged into that branch. This is a production-stopper for SCIM.

Excerpt:

```
1918: WHERE m.org_id = ${orgId} AND u.id = ${userId}
1919: LIMIT 1
1920: `;
1921: if (!rows || rows.length === 0)
1922:
1923: // ---- Groups collection
1924: if (path === '/scim/v2/Groups' && method === 'GET') {
1925: const q = event.queryStringParameters || {};
1926: const startIndex = Math.max(1, Number(q.startIndex || 1));
1927: const count = Math.min(200, Math.max(1, Number(q.count || 50)));
1928: const filterStr = String(q.filter || '').trim();
1929:
1930: let ast = null;
1931: if (filterStr) {
1932: try { ast = scimParseFilter(filterStr); }
```

API surface (high level)

Method	Path
GET	/api/audit
POST	/api/auth/login
POST	/api/auth/logout
GET	/api/auth/orgs
POST	/api/auth/register
POST	/api/auth/request-reset
POST	/api/auth/resend-verification
POST	/api/auth/reset
POST	/api/auth/switch-org
POST	/api/auth/verify-email
GET	/api/health
GET	/api/me

GET	/api/oidc/callback
GET	/api/oidc/start
GET	/api/projects
POST	/api/projects
DELETE	/api/projects/:id
GET	/api/projects/:id

2026 Valuation model

This appraisal uses a replacement-cost baseline plus an enterprise completion budget, then applies a readiness/risk adjustment based on verified controls and blockers.

Replacement cost	$84,000 – $119,000
Completion budget	$105,600 – $149,600
Appraised value range	$68,880 – $115,430

Assumed effort (hours)

Workstream	Hours
Front-end engineering	160
Back-end/API engineering (OIDC+SCIM+exports)	260
DB/schema + security controls	110
QA + security review (incl. CI checks)	110
Docs + delivery tooling (SBOM, workflows)	60
Total	**700**

Terms (plain-English)

• This report and certificate are appraisals based on observed behavior, test artifacts present in the repository, and stated assumptions. They are not warranties.
• Client retains full IP and creative control. Optional patch delivery (PRs or versioned ZIP) is performed only on request.

• Third-party integrations (IdP, email, CI runners) affect outcomes; readiness is assessed against the supplied configuration.
